傳媒備註

有關近日本港傳媒就懷孕婦女接種人類豬型流感疫苗的查詢，本學院現就事件發表以下備註：

- 1) 就現時的科學證據顯示，未有接種人類豬型流感疫苗的孕婦，一旦受到感染，孕婦所相對的疾病風險將較一般人為高。
- 2) 因預料人類豬型流感可能將於社區內傳播，建議孕婦及時接受相關的流感疫苗注射。
- 3) 孕婦於懷孕中後期出現胎死腹中的機會率約為千分之一至二，但至今仍未有科學數據証實，注射人類豬型流感疫苗後會增加胎兒於母體內死亡的風險。
- 4) 孕婦應與主診醫生討論接種人類豬型流感疫苗的利害，以決定應否接受注射。
- 5) 不考慮接種人類豬型流感疫苗的孕婦，應當嚴格注意個人衛生，經常徹底潔淨雙手，並有充足的休息，攝取足夠的營養，避免出入人多擠擁的地方。

如有進一步查詢，傳媒朋友請聯絡：

Press statement

Immediate Release

In response to the recent press enquiry on the issue of human swine flu vaccination

In pregnant women, the HK College of Obstetricians and Gynaecologists would like to issue the following statement:

1. There is scientific evidence supporting that non-immuned pregnant mothers would have higher risk when they are infected with Human Swine Flu, when compared to general population.
2. It is recommended that pregnant women should receive human swine flu vaccination in anticipation of a possible epidemic in the near future.
3. The risk of intra-uterine death at the second half of pregnancy is around 1 to 2 per thousand pregnancies and there is as yet no scientific evidence to support the view that there is increased risk of intrauterine death to pregnant women who had received the vaccination.
4. Each pregnant woman should discuss the pros and cons of human swine-flu vaccination with her doctor and make a decision as to whether to receive the vaccination.
5. If a pregnant woman should decide not to have the vaccination, it is important that she should adopt a vigorous standard of personal hygiene with adequate rest and nutrition. She should avoid crowded environment and frequently wash her hands as is necessary.
